

PRESS RELEASE

Better Generation is ready for Government Feed-in Tariffs

New web based software from Better Generation shows you how to benefit from the new Feed in Tariffs.

Better Generation, the Power Predictor people, has spent the last nine months promoting the Power Predictor as one of the best low cost site assessment tools currently available for wind and solar energy, providing independent information on the best choice of wind turbine or solar array for your specific location.

After the launch of the Feed-in Tariff (FIT) policy on the 1st April, we are now introducing our new web based software, designed to tell you how much you can expect to earn from the Feed in Tariff policy once you have installed a wind turbine or solar array.

Now, not only will you be advised on the best MCS accredited product to purchase but you will also generate a report showing how you will benefit financially from the new Feed in Tariffs, should you decide to invest in a Wind Turbine or Solar Array.

This software launch is not just for new customers; all users, new and existing, will be able to see their enhanced site specific financial report, looking at payback times, annual expected income and CO₂ and energy bill savings.

There is no doubt that Feed in Tariffs will contribute a great deal to the payback time for a wind or solar installation, but just how much is very hard to calculate without the Power Predictor from Better Generation.

If you would like more information on this innovative device, we are exhibiting and presenting at the UK Aware show, or you can take a look at our website: <http://www.bettergeneration.com/>.
